Considerations

Keeping a few things in mind will help in installing, upgrading, and configuring pdf \TeX .

- pdf \TeX is an “all-in-one” processor.
No `\specials`; no `dvips`
- Type 1 fonts work well.
- pdf \TeX uses `kpathsea` just as \TeX does.

Getting It

in a distro
separately

Considerations
Getting It
Upgrading
Configuration
Resources

in a distro

pdf $\text{T}_{\text{E}}\text{X}$ comes with many popular distributions

- including $\text{t}_{\text{E}}\text{X}$, $\text{f}_{\text{P}}\text{X}$, $\text{Mik}_{\text{E}}\text{X}$, $\text{CMac}_{\text{E}}\text{X}$, web2c 's texk ¹
- easy: someone else has done the work

Considerations

¹needs type1 fonts

separately

If your $\text{T}_{\text{E}}\text{X}$ installation doesn't have $\text{pdfT}_{\text{E}}\text{X}$, you can install $\text{pdfT}_{\text{E}}\text{X}$ yourself.

- `ftp://ftp.muni.cz/pub/tex/local/cstug/thanh/pdftex/`
- can be difficult: many interdependent pieces to consider
- binaries
- platform-independent files (in `pdftexlib.zip`)

Many of the issues are the same as for upgrading $\text{pdfT}_{\text{E}}\text{X}$ in an existing $\text{T}_{\text{E}}\text{X}$ installation. See below.

Upgrading

whole distribution
just pdf $\text{T}_\text{E}\text{X}$

whole distribution

While you are upgrading pdf \TeX , why not upgrade everything? By upgrading your entire \TeX installation, you benefit from improvements and bugfixes that you may not even be aware of.

Configuration
Resources

just pdf $\text{T}_\text{E}\text{X}$

There are two ways to upgrade pdf $\text{T}_\text{E}\text{X}$ itself in an existing $\text{T}_\text{E}\text{X}$ installation:

- from binaries
 - advantages: no need to compile
 - pitfalls: binaries may have been compiled for a different location in the system
 - set $\$TEXMFCNF$
 - Remember to install the `*.pool` files too!
 - Rebuild `kpathsea` database with `mktexlsr`.
 - Regenerate formats for pdf $\text{T}_\text{E}\text{X}$ and pdf $\text{E}_\text{T}_\text{E}\text{X}$, including formats for $\text{L}_\text{A}\text{T}_\text{E}\text{X}$ if necessary.
- from sources
 - advantages:
 - you get the source for your perusal
 - you can do a custom build for your machine with your own preferences
 - pitfalls: problems with the sources (e.g. missing pdfetex)

$\text{L}_\text{A}\text{T}_\text{E}\text{X}$ users should remember to make symbolic links or copies of pdf $\text{T}_\text{E}\text{X}$ and pdf $\text{E}_\text{T}_\text{E}\text{X}$ to their $\text{L}_\text{A}\text{T}_\text{E}\text{X}$ counterparts.

Configuration

texmf.cnf
pdftex.cfg
formats

There are a few tweaks to make once pdf \TeX has been installed.²

Considerations
Getting It
Upgrading
Configuration
Resources

²Fonts will be covered in other presentations here at TUG2000.

texmf.cnf

Firstly, pdf \TeX must be able to find `texmf.cnf` itself.

- Binaries can be configured to look for `texmf.cnf` in a certain location.
- If the binaries don't know where `texmf.cnf` is, then they must be told:
`$TEXMFCNF`

There are a few pdf \TeX -specific variables for `texmf.cnf`:

VFFONTS
T1FONTS
TTFONTS
PKFONTS
TEXPSHEADERS

Also, my te \TeX installation's `texmf.cnf` has some pdf \TeX -specific sections, including `TEXINPUTS` and such, that rarely need adjustment.

There is a FAQ about errors regarding a too-small pool size. Pool size is adjustable in the `texmf.cnf` file.

pdftex.cfg

You can set some handy defaults in `pdftex.cfg`. The values set in `pdftex.cfg` correspond to internal registers that can be manipulated in your document if you need to override the default.

Some of the more interesting ones:

- `output_format`
Set to one for PDF output to be pdf \TeX 's default.
- `compress_level`
Set to 0 for no compression, 1 for fastest compression, through 9 for highest compression.³
- `image_resolution`
The default is a low 72, so set this value higher for high-resolution raster graphics.
- `page_width` and `page_height`
pdf \TeX has to know these since it creates PDF directly. Use true dimensions to make the settings immune to magnification.⁴

³Is anyone using 9? Let me know!

⁴te \TeX users take note! te \TeX comes with these dimensions *not* set to true dimensions.

formats

Formats are binary dumps of the memory state of pdf $\text{T}_{\text{E}}\text{X}$ after it loads a given macropackage. Formats allow $\text{T}_{\text{E}}\text{X}$ and friends to run very quickly.

The memory of one executable won't look the same as the memory of a different executable, so whenever you have new executables, you must generate new format files.

- te $\text{T}_{\text{E}}\text{X}$'s `fmtutil` tool

```
fmtutil --edit
fmtutil --all
```
- Con $\text{T}_{\text{E}}\text{X}$ t's `texexec` tool

```
texexec --make en nl uk de
```
- manual format generation
 - pdf $\text{T}_{\text{E}}\text{X}$ has same syntax as $\text{T}_{\text{E}}\text{X}$:

```
pdftex -ini -fmt=pdftex plain "\dump"
```
 - pdf $\text{e-}\text{T}_{\text{E}}\text{X}$:

```
pdfetex -ini -efmt=pdfetex plain "\dump"
```
